INDICATOR

Client Households: Receiving Free Products/Services

Number of unique client households who received free products/services from the organization during the reporting period.

This metric is intended to capture the number of unique client households that received products or services provided by the organization for which it did not request payment and for which it does not expect reimbursement. If the organization expects or receives payment from someone other than the client household, these households should be reported against Client Households: No Direct Payment (PI2180). Organizations should include the unique number of client households that received free products or services, regardless of whether or not these same households may also have paid the organization directly for certain products or services during the reporting period. Many organizations may not be able to report on the number of client households using direct data. For example, organizations that sell water purification systems through a series of local network distributors might estimate the number of client households reached based on the number of units sold. Organizations should footnote details on how and why these assumptions were made. This metric is multi-dimensional with regard to the five dimensions of impact. It may help describe the WHO dimension when the stakeholder group represented by the metric is the stakeholder group targeted by the investment or organization. It may also help measure the HOW MUCH Scale dimension, which helps estimate the number of the targeted stakeholders experiencing the outcome. For more on the alignment of IRIS metrics to the five dimensions of impact, see IRIS+ and the Five Dimensions of Impact (<https://iris.thegiin.org/document/iris-and-the-five-dimensions/>). No single metric is sufficient to understand an impact; rather, metrics are selected as a set across all dimensions of impact. When possible, the selection of metrics to measure and describe the five dimensions should be based on best practice and evidence.

Organizations should footnote all assumptions used, including source of data. See usage guidance for further information.
